

ABSTRACT OF DISCLOSURE

An electric shaver has two elongate shaving heads extending across an upper end of a body on front and rear
5 sides thereof. Each head has co-operable outer cutting foil and inner shearing cutter. A drive mechanism is located in the upper body end and is in drive engagement with the heads for reciprocating the cutters in opposite directions against the corresponding foils for cutting.
10 Each head has a first part and the upper body end includes a second part, which are in movable engagement with each other such that the head is compressible downwardly to move outwardly from the front/rear side of the body, thereby stretching a user's skin flat to
15 facilitate shaving.
